# **1 HP x4000 Service Information**

## Overview

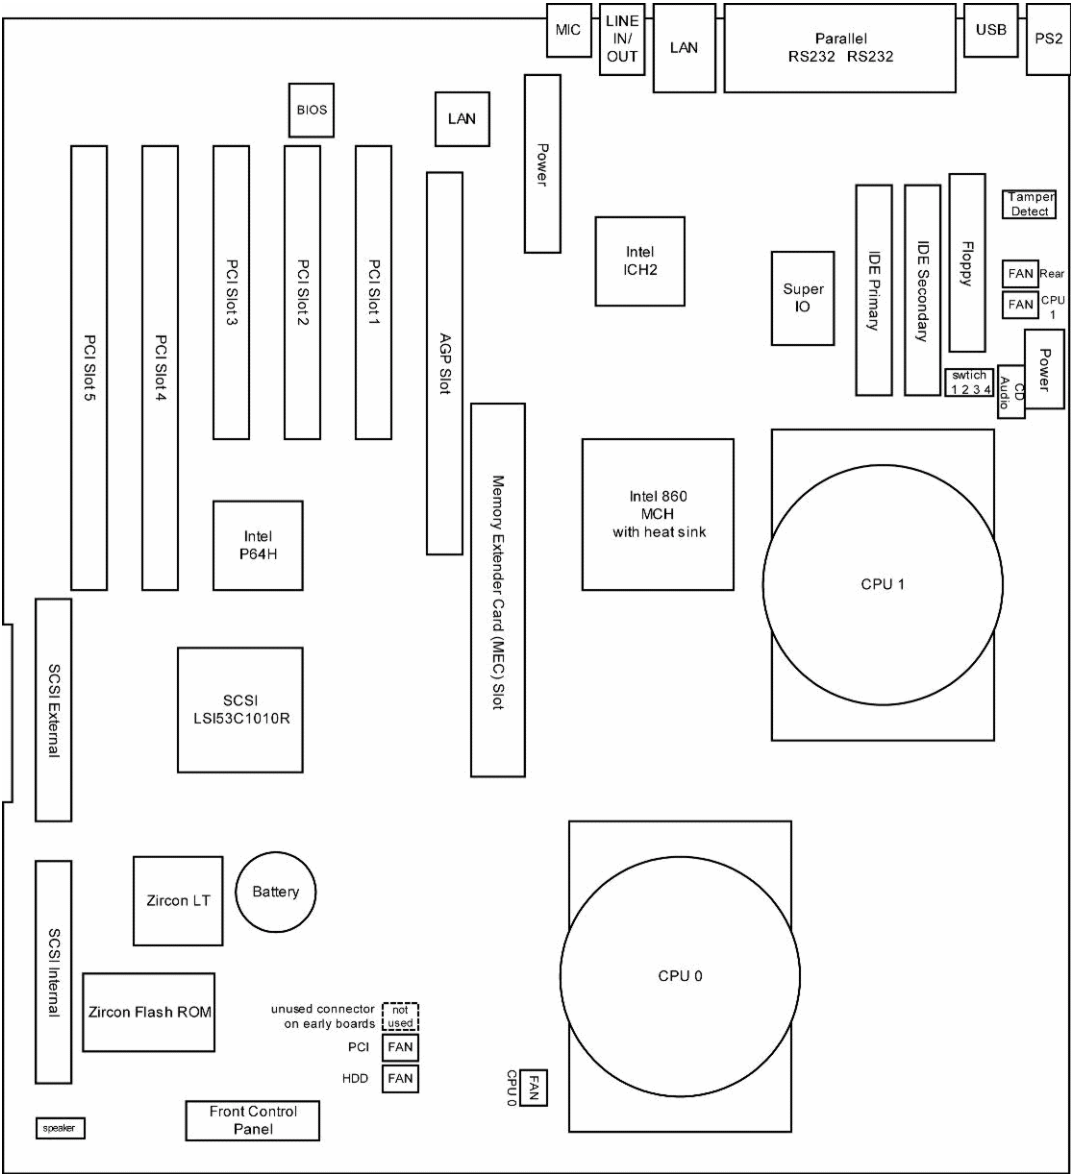

This chapter contains information about:

- “x4000 System Board” on page 7
- “BIOS Identification” on page 9
- “Upgrading Memory” on page 10
- “Replacing or Upgrading a Processor” on page 13

Chapter 2 contains ordering information for x4000 accessories.

Chapter 3 contains ordering information for x4000 parts.

x4000 System Board

## System Board Switches

The system board includes a 4-pole DIP switch, which lets you configure BIOS functions. Because the switches are read only at system start up, you must change the switch positions when the Workstation is shut down.

Switch	Function	Default	Comment
1	Clear BIOS password	Off	Clears both Administrator and User passwords, if they have been set.
2	Boot block recovery	Off	Forces a boot block recovery from a bootable BIOS flash disk in the floppy disk drive.
3	Clear CMOS	Off	Reset CMOS settings to BIOS defaults. You can also do this with the F9 key in the Setup program as described in "Clearing the CMOS" on page 48.
4	Enable safe mode	Off	Force processors to run at 800 MHz. This can be used as a troubleshooting tool or to correct a problem after adding a second processor. Before using this, flash the BIOS as described at <a href="http://www.hp.com/workstations/support">www.hp.com/workstations/support</a> . Use this switch as a last resort. If it gets the system running, replace the processors. If the problem persists, replace the system board.

## BIOS Identification

The system BIOS is identified by the version number *XX.YM.mm*, where:

- *XX* is a two-letter code indicating the system
- *Y* is a one-letter code indicating the HP entity
- *M* is the major BIOS version
- *mm* is the minor BIOS version

## Upgrading Memory

The memory for the HP x4000 Workstation is located on a Memory Expander Card, which plugs into the system board.

There are two memory banks (RDRAM channels):

- Bank I includes sockets 1B (J1), 2B (J2), 1A (J5), and 2A (J6).
- Bank II includes sockets 3B (J3), 4B (J4), 3A (J7), and 4A (J8).

This allows for a total of 8 RIMMs.

You must adhere to the following rules when loading memory:

- RIMMs must be loaded in *matched pairs*. Matching RIMMs have the same RDRAM size, speed and Mbit technology.
- Each RDRAM bank (channel) must be either completely empty or completely filled as shown in Figure 1-2. Therefore, if only one pair of RIMMs is installed in a bank, then the remaining sockets in the bank must contain continuity modules (CRIMMs) to ensure continuity.

---

### NOTE

All Workstations (unless they already have 8 RIMMs) ship with a pair of CRIMMs in case they are needed in future memory configurations. CRIMMS may be stored in an unused memory bank.

---

**Figure 1-1      x4000 Memory Expander Card (MEC)**

Memory Bank I consists of:

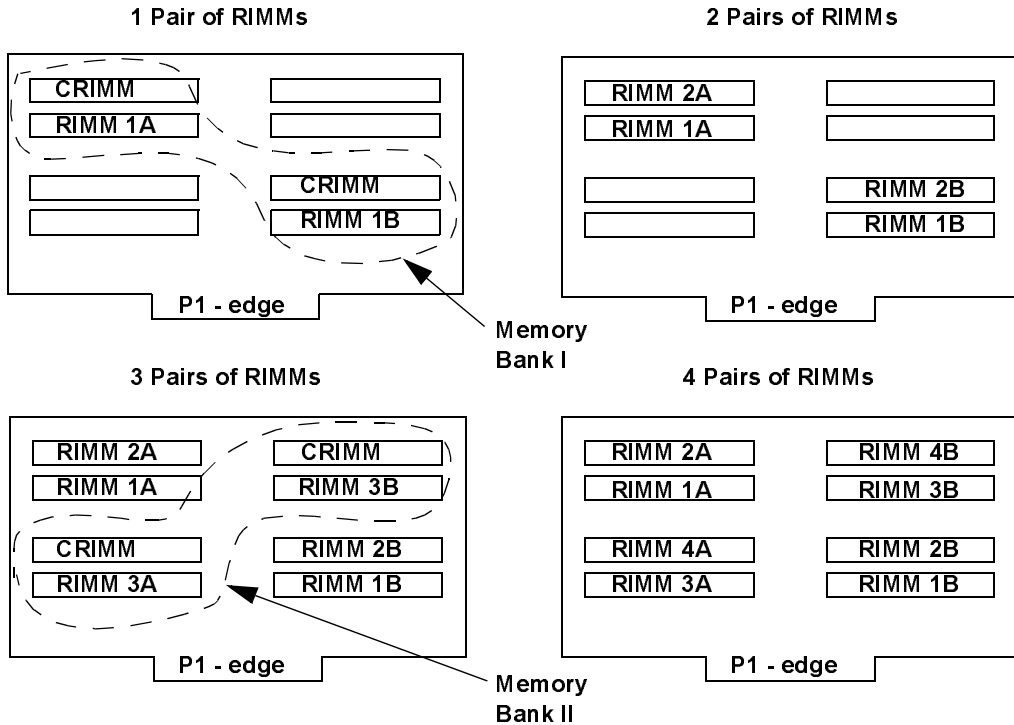

RIMM pair 1: 1A (J5) and 1B (J1)  
RIMM pair 2: 2A (J6) and 2B (J2)

Memory Bank II consists of:

RIMM pair 3: 3A (J7) and 3B (J3)  
RIMM pair 4: 4A (J8) and 4B (J4)

*If a memory bank only contains 1 pair of RIMMs, the remaining  
2 connectors must contain CRIMMs to ensure continuity.*

**Figure 1-2 Replacing or Upgrading Memory**

Note: RIMM 1A and 1B are a matched pair, 2A and 2B are a matched pair, 3A and 3B are a matched pair, and 4A and 4B are a matched pair.

---

## Replacing or Upgrading a Processor

The x4000 Workstation can have two processors. The processors must be identical.

---

### CAUTION

If you are upgrading your current processor, you must update the BIOS. The latest BIOS is located at [www.hp.com/workstations/support](http://www.hp.com/workstations/support).

If you are adding a second processor, you must update your operating system (see “Updating Your Operating System” on page 16).

---

## Removing a Processor

---

### CAUTION

Before removing your processor, turn on the Workstation and let it run for 3 to 5 minutes. This warms up the processor and makes it easier to detach the heatsink. *Be very careful when removing the heatsink.* If your processor turbo cooler fan is not operating, the heatsink may be very hot. Under normal circumstances, the turbo cooler fan is operational and a slight twist of the heatsink should release it from the processor.

---

To remove a processor:

1. Turn off the display and shut down the Workstation. Disconnect all power cables and any LAN or telecommunications cables.
2. Remove the Workstation's cover.
3. Place the Workstation on its side for better access.
4. Open the hard disk drive cage.
5. Remove the Chassis Beam Assembly.
6. Remove the MEC card.
7. Remove the heatsink power connector from the system board.

8. Remove the two heatsink clips by pressing the release lever on the clips. Then lift off the heatsink. There is a thermal interface material between the heatsink and the processor. This may cause the processor to stick to the heatsink.

**Figure 1-3**      **Removing a Processor**

9. Remove the thermal interface material from the heatsink and discard it. You can leave any residue that remains on the heatsink. This does not impair the heat transfer.
10. Open the Zero Insertion Force (ZIF) lever, located at the side of the processor socket, until it is in the vertical position (depending on the socket design, the handle may need to go past vertical), then carefully lift out the processor. To avoid bending the processor pins, keep the processor perfectly flat when removing it.
11. Store the processor in an anti-static bag (such as the one provided with the replacement processor).
12. If you are permanently removing a second processor, you must update your operating system (see page 16). You should also store the heatsink and clips in a safe place.

## Installing a Processor

To install a processor:

1. Turn off the display and shut down the Workstation. Disconnect all power cables and any LAN or telecommunications cables.
2. Remove the Workstation's cover.
3. Place the Workstation on its side for better access.

4. Open the hard disk drive cage.
5. Remove the Chassis Beam Assembly.
6. Remove the MEC card.
7. Ensure the processor is correctly oriented by matching the notches on the processor to the notches on the ZIF socket. Then carefully lower the new processor into place. When the processor is fully inserted, close the ZIF lever.

---

**CAUTION**

---

Be extremely careful when you insert the processor. If you bend one of the pins, it will not go into the socket.

**Figure 1-4 Inserting a Processor**

8. Affix the new thermal interface material, provided with the new processor, to the top of the processor.
9. Attach the heatsink to the processor. Use the retaining clips to attach the heatsink. For easier installation, partially attach both clips by hooking one end of the side slot in each clip. Press down on the remaining ends of both clips until they click into place.
10. Connect the heatsink turbo fan power connector to the system board. The fan connectors are labeled CPU0 and CPU1 on the system board.
11. Replace the MEC card.
12. Replace the Chassis Beam Assembly.
13. Close and secure the hard disk drive cage.
14. Replace the Workstation's cover.

15. Reconnect all the power and telecommunications cables.
16. Update your operating system (see page 16).

## Updating Your Operating System

If you are adding a second processor to a Workstation (or removing a processor), you must update the operating system to reflect these changes.

### Windows 2000

To update the operating system in Windows 2000:

1. Go to the Control Panel by selecting **Start > Settings > Control Panel**.
2. Select the **System** icon.
3. In the Hardware tab, select **Device Manager**.
4. Expand the **Computer** branch. The type of support that you currently have is displayed:
  - **ACPI UniProcessoor PC**
  - **ACPI MultiProcessor PC**

To change the type of support, double click on this icon to bring up the ACPI PC properties.

5. In the Driver tab, select **Update Driver**. The Upgrade Device Driver Wizard appears and you must select **Next** to continue.
6. Choose to display a list of all the known drivers and click **Next**.
7. When all the drivers are located, click the radio button to show all hardware of this device class, select one of the following and click **Next** to install the new driver:
  - **ACPI MultiProcessor PC** if you have added a second processor.
  - **ACPI UniProcessoor PC** if you have removed your second processor.

### Windows NT

To update your operating system in Windows NT, use the HP DualExpress utility which is posted at [www.hp.com/workstations/support](http://www.hp.com/workstations/support).

## 2

## Supported Accessories

<b>Intel Xeon Processors</b>	
1.5 GHz	A6078A
1.7 GHz	A6079A
<b>System RAM</b>	
256 MB PC800 RDRAM (1 pair 128 MB RIMMs)	A6081A
512 MB PC800 RDRAM (1 pair 256 MB RIMMs)	A6082A
<b>Hard Disk Drives</b>	
18 GB Ultra3 SCSI hard disk, 10k rpm	A5995B
36 GB Ultra3 SCSI hard disk, 10k rpm	A6060A
<b>Removable Mass Storage</b>	
48X IDE CD-ROM drive	A7209A
12X IDE CD-Writer drive	A7212A
12X DVD drive	A7211A
<b>Graphics Cards</b>	
Matrox Millennium G450 dual 16MB graphics card	A7192A
nVidia Quadro2-MXR graphics card	A6064A
nVidia Quadro2-PRO graphics card	A6065A
ATI FireGL2 3D graphics card	A6076A
ATI FireGL4 3D graphics card	A7226A
<b>Monitors</b>	
HP LCD 18"	D5069W
HP 19" Color	D8912W
HP 21" Color	D8915W
<b>Power Cords</b>

Korea (AB1)	
Europe (ABB)	
China (AB2)	
Hong Kong & Singapore (AB5)	

North America (ABA)
Australia (ABG)
Japan (ABJ)
Argentina (AC8)
United Kingdom (ACC)
Switzerland (ACD)
South Africa (ACQ)
South America (AKH)
Israel (AKJ)

## Mass Storage Device Guide Rails

Extra guide rails are attached to the side of the Workstation chassis for additional mass storage device installations. Depending on the device to be installed, dedicated guide rails are required and are easily recognized by their distinct size and color.

The following table indicates the device, location, and required rails.

Device to be Installed	Location	Required Rails	Installing the Rails
5.25-inch device (CD-ROM, etc.)	5.25-inch front access cage shelf	Wide black rails	There is no specific side to which these guides must be installed. However, they must be inserted in the two holes located at the bottom of the drive.
3.5-inch device (floppy, zip drive, etc.)		Narrow green left and right rails	Carefully break off the metal plate from the chassis. Insert the guide rail labeled "L" on the left-hand side (cable connectors facing towards you and positioned at the top), and the guide rail "R" on the right-hand side of the hard disk drive.

---
